

# **Generation Restoration: Shaping our Future**

(Original)

Omeokwe Mmaduabuchi Gregory

(Age 20, Nigeria)

Faculty of Environmental Sciences,

Epe Campus, Lagos State University.

The modern world is full with man-made structures, but how can we keep them around? Find the answer in the theme called "Generation Restoration." First things first, let's define: Making something new is what we mean when we talk about generation. Those born within a certain time frame who have similar life experiences and ideals are the focus of this group. Restoring anything is bringing it back to its original state. Restoring something is bringing it back to its original condition or putting it back in the correct sequence. By combining Generation and Restoration, we get to the heart of the matter: helping the present generation and the ecosystem recover from the damage that humans have caused. We need to make sure this is done in a way that won't hurt generations to come.

Here are some important things to think about: Firstly, the built occupancy buildings, goods, landscapes, interiors, and cities are all part of what is called the built environment. All of these things make up our surroundings. It is our duty, as citizens of the twenty-first century, to protect and defend the status quo. Infrastructure is important, but maintenance is much more so. The repercussions of our indifference should not be felt by subsequent generations. The maintenance of these buildings requires action from the government. The natural world is losing its natural beauty. There is a delicate balance in nature, and when humans mess with it, disaster strikes. We must preserve and protect our natural environments, including forests, mountains, rivers, and deserts. Future generations will benefit from our efforts to protect built and natural environments.

Secondly; molding the course of our future and reviving the mother earth is in jeopardy due to overpopulation, pollution, deforestation, and climate change. She was once vibrant and flourishing. Her ecosystem is in a state of crisis. As a result, people all throughout the world are becoming involved: Being a part of sustainable programs such as Reforestation, recycling, and trash cleanup Fighting ecological degradation through environmental activism, Stressing the importance of environmental education,

Championing eco-friendly energy sources and leading the way in sustainable innovation, Reducing reliance on fossil fuels by encouraging more walking By taking these steps, can help bring the planet back to its natural state and ensure a healthy environment for generations to come.

Thirdly, long-term sustainability developing in a sustainable way means meeting our needs now without compromising our ability to meet the needs of generations to come. The next generation has a responsibility to responsibly care for Earth by reusing and recycling materials, building renewable energy systems, and embracing AI and smart technologies. Progress in housing, infrastructure, and agricultural technology must be approached with caution.

Most importantly, the natural elements, such as woods and trees, that we often fail to appreciate are vital and should be preserved. The protection of these places is greatly assisted by scientists and environmental campaigners. And the importance of environmental stewardship must be communicated to the general population. In this regard, restoring generations doesn't have to be a complicated concept.

The future and the planet's well-being are guaranteed if people especially the youth care, have compassion and understand the need of maintaining a balanced and sustainable ecology, we would achieve a peaceful world we yearn for.
