

Watchers or Warriors?

“The greatest threat to our planet is the belief that someone else will save it.” These words capture the urgency of our environmental crisis. With millions of hectares of land lost yearly and over one million species at risk, climate change is an undeniable reality. In Nigeria, desertification, deforestation, and erratic weather continue to threaten food security and livelihoods.

The solution lies in restoration—reviving ecosystems, increasing biodiversity, and promoting sustainable development. Practices such as agroforestry, wetland recovery, and urban greening offer effective ways to heal the planet.

Youth play a major role in this mission. As climate change ambassadors, they raise awareness, lead restoration projects, and advocate for climate justice. From rural farms to urban centers, their efforts are reshaping landscapes and inspiring communities.

My personal journey, including agroforestry research and youth engagement through the NBSAP, reflects young leader’s potentials in driving change.

Generation Restoration is more than a campaign. It is a movement calling everyone to act. Whether planting a tree or mobilizing for policy reform, every contribution matters.

Our future depends on the choices we make today. Let us rise as the generation that healed the Earth—not the one that watched it fade.
