

Generation Restoration: Shaping Our Future

Studying Forest Resources & Wildlife at the University of Benin has changed the way I see the world. I don't just walk past trees anymore, I see life, balance, and a future quietly depending on us. I've learned how much has been lost... but I've also learned how much can still be restored.

Generation Restoration isn't just a theme to me, it's the reality I'm being trained to face. In our lectures, we talk about climate change, deforestation, and ecosystem collapse. But we also talk about hope, about mangroves coming back to life, forests rebounding, and species returning home.

And that's the version of the future I choose to believe in.

We are the generation that can heal. Restoration is not too big, not too late, it starts from the soil we protect, the waste we reduce, the forests we defend, the people we teach.

This isn't just education anymore. It's a call. One I carry with me into every class, every conversation, and now, into this entry.

We are not just inheriting this planet. We are shaping it. And we must restore it, not just for ourselves, but for everything and everyone yet to come.
