

Marine Protection

Every year over 100 million marine animals die due to human pollution. Causes range from oil spills at sea, throwing garbage into the ocean and even dropping a plastic straw on the beach.

We have to address the elephant in the room. The Great Pacific Garbage patch. Located in the North Pacific Ocean, it is a massive accumulation of marine debris. This anomaly was probably created when the tide came up at night and garbage left on beaches gets dragged back into the sea and taken by currents called gyres which trap debris including micro-plastics and larger items.

A good solution would be to integrate little rewards for throwing away or recycling garbage properly. This can be done in moderation for example a special bin on the beach that gives out candy when you properly dispose of trash, to incentivize people to clean up beaches and step by step we can build a world free of pollution and we

can live happier.

In the end, humans as a race must appreciate and protect the ocean. Why? Because it is our silent caretaker. Without the ocean, Earth's oxygen would be unbreathable and, even worse, there would be no more sea food.
