

NAME; OCHULOR PRECIOUS

TOPIC; GENERATION RESTORATION; SHAPING OUR FUTURE.

Generation restoration refers to the responsibility of today's youth and future generations to repair, protect, and sustain the environment and society through awareness, sustainable actions, and innovation solutions.

In recent decades, the world has experienced significant environmental damage, climate change, pollution, and social inequality. These challenges not only threaten the planet's ecosystems but also jeopardize the quality of life for future generations. Generation restoration matters because the actions we take today will determine whether we leave behind a healthy, thriving planet or one burdened by environmental and social crises. This movement is powered by the determination and urgency of young people who are committed to reversing these trends.

One of the primary ways generation restoration makes an impact is through environmental responsibility and sustainability. Young activists lead initiatives like waste reduction, and the promotion of clean and renewable energy sources. Alongside these efforts, technological innovation plays a critical role. Advances in renewable energy, sustainable agriculture, and captures hazardous gases offer practical tools to reduce humanity's ecological footprint and reduce climate change. Social equity; Generation restoration promotes equity, ensuring that restoration includes everyone, not just a few. It also values collaboration between young people and older generation to combine wisdom with fresh ideas.

In conclusion, Generation restoration is about acting on solutions, solutions like planting trees that was destroyed, reducing plastics, inventing clean technologies and raising awareness. Generation restoration is about hope, action and change. For example; In India, schools plant trees every year to help clean the air. In Kenya, young people clean beaches and recycle plastic. In Canada, families reduce food waste by buying only what they need. In Nigeria, communities are learning to turn waste into useful products. These actions may seem small, but together they bring real change. As youth of this Country we have to play our part either by planting one tree, picking up plastic or using less electricity, for the betterment of our future.
