

TITLE: GENERATION RESTORATION: SHAPING OUR FUTURE

The beauty and rhythm of nature are gifts that God has given to mankind. However, there are some things threatening this wonderful gift. These threats include the deterioration of ecosystems, destruction of forests, pollution and climate change. These problems are chiefly caused by human. Conversely, if we, especially young people, take action through innovation and commitment, we can build a sustainable future where humanity lives in harmony with nature.

We can achieve this by restoring the ecosystem. For example, we can protect wildlife habitats and improve soil and water quality. We can plant trees which serve a dual purpose in the ecosystem. They provide food which supports both communities and wildlife. They also improve the ecosystem by absorbing carbon dioxide, at the same time ~~releasing~~ releasing

Oxygen.

Another crucial approach is recycling. It helps in reducing the amount of waste in oceans and landfills, thereby curbing the adverse effects of pollution. Recycling also conserves natural resources by turning discarded materials into new products. For example, plastic can be transformed into furniture, ornaments, or even clothing.

Our future is intertwined with the health of our planet, therefore, we must contribute to the momentum required to restore nature.
