Generation Restoration: Environment Protection

Generation Restoration is the process whereby individuals work together to fix the damage done to the earth and to protect the environment for future generations.

To restore the environment, it is important to stop harmful practices that damage it. Deforestation should be reduced and when trees are uprooted, they should immediately be replaced by new ones. This lessens the carbon dioxide released into the atmosphere. Additionally, organic farming should be encouraged to limit the quantity of pesticides entering the soil.

However, Generation Restoration is not just about stopping harmful practices, it also develops safer alternatives. A well-known method is the 3Rs - Reduce, Reuse, and Recycle. This minimizes waste by reducing the things we throw away and finding new uses for them, rather than discarding them.

Generation Restoration can be practiced by anyone, regardless of age. A simple action even by a kid such as deciding to walk to school, instead of being driven by their parents, could go a long way. Generation Restoration is very crucial as it caters not just for the current generation, but it protects the environment for the future.
